INTRODUCTION.

MIROSLAV HAVEL published his first work at a time when the Bohemian Problem-school was already in a flourishing stage of its development. The beginnings of that school were small, and date from the sixties of the last century, a period coincident with the first development of the chess club. At that time, in addition to written and lithographed chess periodicals, which did not enjoy a long life, and which have now only an historical interest, the chess column began to appear as a regular newspaper feature. Chief among these early columns may be mentioned: *Rodinna Kronika*, *Kvety*, *Svetozor*, *Humoristicke Listy*, *Palecek* and others. They contained for the most part problems and games, with here and there articles on the theory and æsthetics of the problem. It was these articles that laid the foundation of the Bohemian problem school. Chief among the columns of that day was the weekly *Svetozor*, and it maintained its lead for a long period. On the problem side it exhibited the development as well as the history of the Bohemian problem, and was greatly influenced by the ingenious Dr. J. Dobrusky. It is chiefly due to him that the traditions of the Bohemian school were created and fostered. In the *Svetozor* the publication of successful problems from local and international tourneys inspired and encouraged both old and new adepts of the art. In 1885 *Zlata Praha* (Golden Prague) took over the leadership from the *Svetozor*.

The output of the school grew to such an extent that in 1887 it became possible to publish a first collection of Bohemian problems. The volume contained 321 problems by forty-one composers, and an interesting introduction by J. Pospisil in the shape of a theoretical study of the Bohemian problem, a study which, in the main, is even to-day quite up-to-date. The following are the composers represented:—Cimburek, Dr. Cernovsky, Dr. Dobrusky, Drtina, Fiala, Freytag, Frohmann, Hanc, Hinkenikl and Kahles, Hochmann, Chmelar, Chocholous, Kober,

Kollmann, Kondelik, Konig, Kotrc, Koutnik, Dr. Kvicala, A. and K. Makovsky, Dr. E. Mazel, Moucka, Dr. Musil, Paclt, Pajkr, Pilnacek, J. and K. Pospisil, Racek, Slavik, Schaferling, Svejda, Smutny, Toscani, Traxler, Dr. Tuzar, Valenta, Vetesnik, and Votruba. Thanks to this representative collection, the Bohemian school became popular, and penetrated every frontier of the world of chess. Most of these above-named pioneers have long since died, and the few that remain, with the exception of Chocholous, Kotrc, Traxler and Vetesnik, have left off composing. To the talent of these early pioneers the fame of the Bohemian school is due.

Our most distinguished composers in the decade 1887-1897 were Behal, Cumpe, Hostan, Kesi, Kosek, Dr. Klir, Dr. Palkoska, Zimmermann and others. In 1896 the first Bohemian chess monthly was founded, *Ceske Listy Sachove*, but owing to insufficient support it ceased publication after four years. A similar fate attended *Sachove Listy* (founded 1900) after three years' existence. Despite great enthusiasm and personal sacrifices both these periodicals succumbed, but in their place several chess columns made their appearance in different papers and did much to popularise chess among the public generally.

In 1905 the various chess clubs united into an association under the name of *Ustredni Jednota Ceskoslovenskych Sachistu*, and under the auspices of this association the monthly *Casopis Ceskych Sachistu* (afterwards changed to *Casopis Ceskoslovenskych Sachistu*) was established in 1906. This periodical was founded on so sound a basis that it has been able even to survive the horrors and tumult of the world war. Although the Bohemian school developed according to principles laid down by generations of national composers, nevertheless at different times a tendency to deviate would manifest itself in the individual genius and character of some gifted composer. Among those composers who have stamped upon the school special characteristics, perhaps the most important is Miroslav Kostal, or, as he is known throughout the chess world, M. Havel.

Born at Teplitz, Bohemia, on November 7th, 1881, Havel has lived since 1884 in Prague, where

he studied at the High Technical School. From 1906 onwards he has been an official of the Austrian State Railways, and since the establishment of the Republic an official of the Czechoslovak Railway-Ministry. He published his first problem on May 1st, 1898. After a relatively short period of probation he began to produce works of great depth and beauty, and with such marks of a rare talent as to give promise of being able to surmount every obstacle and reach the loftiest heights. He was speedily acclaimed as a leader who opened up new ways and pointed to new aims.

At this time Bohemia was full of rising talent, as may be judged by the following list: Dr. Mach, Cisar, Skalik, Hlineny, Drnek, Kuneticky, and somewhat later, Knotek, Moravec, Bosch and Matousek. In Moravia: Dr. Prikryl, Trcala, Dittrich, Stritecky, Dedrle, Milica, Volf, Dr. Prochazka and, a little later, Kainer. But Havel's problems were of such high quality that they easily surpassed those of his contemporaries. It was evident that under his influence a new problem-type, easily to be distinguished from the old one, was being created. Havel arouses immediate interest by his choice of themes for his problems. With admirable taste and masterly handling he continually produces new pointed combinations with a surprisingly delicate structure.

It is perhaps not by chance that he seems to avoid combinations with White Pawns. With his great experience and skill he is under no necessity of employing means that fail rigorously to comply with the laws of economy. Nevertheless we find him no less a master of construction in problems where the principal part is played by the White Pawn.

Havel's strength and greatness are due to his unerring judgment, and to a capacity to select the right material for the right combination. He expresses the chosen theme in just the right form with such subtlety that he fully exhausts the combination in all its phases. Although he imposes on himself as rigorous a discipline of thought as he does on his chess material, he is able to produce a form classical in its beauty,

compressed to the utmost, conforming to rule and yet elastic with a display of originality and an absence of restraint which evoke admiration.

This clearness of theme and purity of form, with his finely - conceived ideas polished into veritable gems, are the chief characteristics of Havel's great art. He unhesitatingly renounces cheap theatrical effects, and turns resolutely aside from all combinations of the trick and puzzle order.

For instance, the White King plays as a rule an unimportant part in a problem. Even the checking defence is in most cases a pseudo-combination brought in only to avoid perhaps a dual or to ensure correctness, and having no connection at all with the real idea of the problem. It is often quite superfluous, and could be eliminated without any damage to the illustration of the combination. Nevertheless, problem literature furnishes many examples of the principal rôle being assigned to the activity of the White King. Take for instance the famous

The "Steinitz Gambit."

By S. LOYD.

First Prize,

Checkmate Novelty Ty.,
1903.

Mate in three.

1. Ke2 !!, Pfl=Q+;

2. Ke3.

Pfl=S+;

2. Rf2+.

"Steinitz Gambit" problem by Loyd. Loyd put the whole effect of the problem into the extraordinary, baffling and theatrical key. But if the solver has the courage to make this Key, the rest of the solution which is based on uncovering the batteries is easy.

Now compare with it Havel's exemplary translation into the Bohemian. In No. 30B the active force of the White King on e1 is expressed most economically, and Havel, by imparting his strong individuality into the King's attack, is able to grip and

extend the interest of the solver right up to the last move.

He analyses the rich possibilities of each theme logically, with a particularly clear perception of its most complete expression, and it is only

natural that as an outcome of this unity of thought an echo is so often produced. We cannot say that Havel was the inventor of those wonderful echo problems, but whoever studies his collection will be easily convinced that Havel has a predilection for this kind of problem, and that his greatest successes are achieved in this field. From a psychological standpoint it is easy to understand the temptation to dwell on and repeat favourite combinations, like a melody in a different key, which after all constitutes the echo. The subjects of his echoes are either whole combinations or mating positions, and these are reproduced in a multiple form, either in a positive or negative way. He does not use easy, symmetrical positions but produces a symmetrical thought in an asymmetrical form. Nor is it always the model-mate which is echoed: he understands also impure but economical mates: his echoes are produced in strict harmony with rigid economy. Nowhere is there a sign of artificiality or laboured construction. The whole structure is invariably beautiful in its simplicity.

Owing to this rigorous adherence to economy the Bohemian school eschews sacrificial combinations and thereby abandons those fireworks which are so dear to the beginner, and which may be regarded as the device of undeveloped art. Sacrifices are in reality a veiled uneconomy, a riddance of superfluous pieces. Therefore we find in Havel's problems very sparing use made of sacrifices, and then only when they form an essential part of the idea.

Since June 19th, 1920, Havel has been chess editor of the column in *Cas* (Time),* which with the *Prager Presse* (edited by Dr. Mach) is the most important Bohemian chess-column. Havel is also a very fine solver. With surprising facility he is able to detect the author's idea, picking out the landmarks of the solution almost at sight. His honour list in International problem tourneys is quite imposing. He has gained 38 prizes, of which 16 were First Prizes, besides 15 honorable mentions. But it would not be doing justice to his art if only those problems which gained

*At the beginning of 1923 the *Cas* ceased to appear.

success in International Tourneys were to be considered. Many of his problems published in different chess columns take rank easily among his best. *Zlata Praha*, which for some time published many of his original problems, enjoyed the greatest popularity on that account. Havel, like many other great composers, does not seek fame by adding to the number of his tourney successes. He pursues his art for Art's sake, and often hesitates to send his works before judges who may be suspected of finding merit only in superficial splendour. All outside show is distasteful to him, and his problems for the delicacy of their setting alone will probably never be surpassed. Art is international. In time Havel's classical Bohemianism will become common property. That he gave to the Bohemian school this classical style is a reason which by itself makes his work worthy of being studied and criticised with the great earnestness it deserves.

NOTE.—Many of the problems have additional variations of less artistic character than those given in the printed solutions. These the composer does not consider as forming any part of his themes, but simply as necessary to conform to the usual requisites of soundness, and he prefers to leave their analysis to the ingenuity of the solver who may care to investigate them.

BLACK.

WHITE.

Mate in three.

No. 98.

In problems in retro-analysis in which the King and Rook are on their original squares, we make the necessary assumption that Castling is legal unless evidence is forthcoming to prove otherwise.

Thus, in the present problem, we will begin on the definite basis that White has a legal right to play Castles QR, and Black also has the same right. For the present, therefore, a1, e1, e8, a8 have NEVER moved.

The men captured are, for Black—Q, R, B, S, S.
for White—B, S, S, dP.

Now Black has necessarily made four captures: f7×g6, e7×f6, a7×b6×c5, accounting for all captured White men. We note here that if Pb7-b6×c5 and Pa7×b6, then the Ba7 has no mode of entry. Thus the captures here were Pa7×b6×c5 ONLY.

As the White dP was captured [or its equivalent after promotion was captured], this dP must certainly have made one capture (to c5), [or two captures if it promoted anywhere except e8, which our present assumptions forbid].

As the White KR has moved OUT, either to f7 or to be captured, the Pg4 has not recently come from g3 or g2, nor the Pf3 from g2—any of these retractions would necessitate a White K-move and destroy White's power of Castling QR.

Now with White to play, Black has just moved, but the special form of the position will lead us more quickly to definite results if we consider White's "freedom"—the very few moves he may at present retract which do not destroy his power of Castling QR. We see Pg2×f3, and Pg2-g3-g4 are NOT available. Also, the Rf7 did not come from e7 or f8 recently, and, if it did, then the Black K must have moved. Therefore White's only immediate "free" moves are Pa2-a3-a4 and Pe2×f3, three moves in all.

Thus, unless Black can arrange his retractions to liberate White in some place, we shall arrive at a retrograde-stalemate of White where he *must* have moved his King, or the Ra1, or the Pg4—in any case destroying his power of Castling QR.

How then can Black give White more freedom? In dealing with this question, we must inspect the north-east corner of our position and see how the men arrived there. As Black has 8 Pawns on the board, the Ba7 came originally from f8. Hence we must return this B to f8 before returning Pf6 to e7. Supposing that done, we see Rf4-f7, Bc4-g8, Qd5-g8-h8 are a simple system of moves which get the men f7, g8, h8 safely into position without disturbing the Black King. The Black KR was evidently captured by the White Q on g8 or h8 in this process.

It follows from this inspection that Black must release White, if at all, by uncapturing $Pb6 \times c5$ to give White some liberty. This necessitates $Pb6$ back to $b7$, $Ba7$ out to $a5$, and then $Pb6 \times c5$ may return. But we are confronted here by the fact that the $Ba5$ checks $e1$. To retract B to $a5$ needs a White K-move, or NEEDS an interception on $b4$, $c3$ or $d2$. The only man we can possibly use to intercept the line $a5-e1$ will be the Black man that reappears on $f3$, and so we necessarily arrive at the "try" to free White by :

1. $Pb7-b6$ (the $Bc8$ does not matter, as there are plenty of Black men for White's few captures), $Pe2 \times Sf3!$ 2. $Sd2-f3+$, $Pa3-a4$; 3. $Bb6-a7$, $Pa2-a3$; 4. $Ba5-b6$, successfully preparing the way for $Pb6 \times c5$, but failing by a single move. At this point, White has used all his "spare" moves, and may retract only moves by his K, the $Ra1$, or the $Pg4$, meaning that Castling is illegal in each case.

Now Black has no other way whatever of "freeing" White if we maintain our initial assumption that Black may Castle QR.

Therefore, IF BLACK MAY CASTLE, WHITE MAY NOT CASTLE.

This, however, does not exhaust the logical possibilities. On the basis of a definite hypothesis about BLACK, we are logically compelled to abandon the parallel hypothesis about WHITE.

But supposing we refuse to abandon White's right to Castle, then it is evident Black must have moved his K, whereby the $Rf7$, etc., obtain "freedom."

Thus, IF WHITE MAY CASTLE, BLACK MAY NOT CASTLE.

(Up to this point, the idea of the problem is not altogether new, as a few illustrations of the same theme have been published. But in the concluding argument, to which we now arrive, the problem is absolutely original).

Armed with the above knowledge, that *either* side may Castle QR by assumption, but not *both*, we now investigate the possibilities of giving mate. We find that if Black may Castle QR, then there is NO MATE IN THREE. But if Black may not Castle QR, then White easily mates in two, by 1. $R \times g7$ or 1. $Q \times g7$.

How can we guarantee that Black may *not* Castle QR? If we play 1. $R \times g7$ or 1. $Q \times g7$ (or 1. $Rd1$) we assert nothing about Castling for either side. Happy thought! Let us play 1. Castles QR! and now for certain, Black may NOT CASTLE in defence. We then find after 1. Castles QR, that White successfully mates in three.

(Analysis kindly supplied by T. R. Dawson).
